1. Our approach to continuous integration

Our continuous integration methods consisted of automated testing and building to ensure bugs were caught and fixed as early as possible. This is appropriate because multiple people are working on the same codebase and some changes may have unintentional effects.

2. Overview of our CI infrastructure

Our CI was implemented with github actions and does two things in parallel on every commit to main.

First it builds the project from source on a clean system and runs automated tests, marking the commit with a check or cross if it passed all or failed any tests.

Second it creates a dependency graph which lets us more easily identify if we need to update any dependencies due to security vulnerabilities.
