1. Overview of our process for updating deliverables

All changes to deliverables were made on google docs. In order to make changes to the deliverables and keep the formatting, we had to ask for the google docs and not the pdf files that were put on the website. All changes to the code were made through github.

When it came to planning the changes that we wanted to make to the code and documentation from assessment 1, we had a meeting where we discussed how we were going to implement the rest of the required features that are needed for the program and any additional features that we might add. With everyone having a basic understanding of the features we could split the work up and the changes made to each document should line up and make sense together.

Changes made to the code, in order to keep track of what was original and what was added/changed in assessment 2, comments were made in the code to show where these changes were made. The changes can also be seen in the commit history on github.

Changes to the deliverables can be kept track of in a separate document that has a table which has fields for the date, document changed and what was changed. Each of these fields help with the write up of the second part of this document by having all the changes listed in one place instead of looking through the reason history built into google docs.

Changes to the code can be reviewed by another group member before pushing to make sure the code is readable and the code can be tested to make sure that it works.

Changes to the deliverables can be reviewed during meetings or the group can be asked through the group chat to check changes to deliverables to make sure what has been changed makes sense and is coherent with the rest of the deliverables.

2. Changes to deliverables from Assessment 1

Requirements

URLs: 1. Original document :

https://6708f185-154c-4209-83c3-4f5273aa7fbf.filesusr.com/ugd/53bd28_e49047177b0f4d48a2a5f195cec39f38.pdf

2. Updated document :  Req2

Changes made to the Requirements document:

1. Added paragraph 2,3 and 6 to our introduction

Justification: Our understanding of the requirements document had been significantly altered based on feedback received and our focus for the second assessment shifted towards addressing all implementations

2. Added UR LEADERBOARD

Justification: Following group discussions, we determined that this would be a key implementation for our game and hence gave it high priority. Furthermore, this was a requirement of the assessment 2 rubric

3. Added UR_SCORE_SYSTEM

Justification: To build a functioning leaderboard, a score system must be created and successfully implemented. This is in line with the high priority we have chosen.

4. Added UR_ACHIEVMENTS

Justification: To keep the user engaged and to create a further incentive to play the game over and over again, we suggested an achievement system where milestones can be achieved in each individual game. As this was an extra feature, we gave this low priority.

5. Added FR_USERNAME

Justification: As part of the leaderboard system, a username will be collected to explain the ranking clearly to the user. We determined that this was a functional requirement as users must enter their name to be displayed on the leaderboard

6. Changed UR_VISUAL_AND_SOUND_EFFECTS to FR_VISUAL_AND_SOUND_EFFECTS

Justification: This describes system behaviour providing feedback to user interaction, such as placing a building or triggering an event. Therefore, this is a system function compared to a user expectation.

7. Changed UR_GAME_UPDATES to NFR_GAME_UPDATES

Justification: This refers to future maintainability, not user-facing expectations

8. Changed FR_VERSION_CONTROL to NFR_VERSION_CONTROL

Justification: This deals with development infrastructure which is not a functional requirement.

9. Changed NFR_SATISFACTION TO FR_SATISFACTION

Justification: Given that satisfaction refers to the score the system must calculate to achieve UR_SCORE_SYSTEM and UR_WIN_CONDITION, it must be a functional requirement.

10. Changed NFR_EVENTS_GENERATOR TO FR_EVENTS_GENERATOR

Justification: This describes core behaviour of the game (generating in game events) which directly impacts gameplay mechanics and user interaction.

Architecture

URLs: 1. Original document :

https://6708f185-154c-4209-83c3-4f5273aa7fbf.filesusr.com/ugd/53bd28_5310ac0f47324ccabe544b3a512de00a.pdf

2. Updated document :  Arch2

Changes made to the architecture document:

1. Added UML diagrams of functions and classes that were added to the code.

Justification: Allows anyone that works on the code base to see how the different parts of the code interact.

2. Added description of how new functions and classes function.

Justification: Allows anyone that works on the code base to get a better understanding of how certain functions/classes work if it is not clear from comments and the code itself.

3. Added justifications for why new function and classes were needed

Justification: To meet the criteria for the architecture documentation.

Method selection and planning

URLs: 1. Original document :

https://6708f185-154c-4209-83c3-4f5273aa7fbf.filesusr.com/ugd/53bd28_a1576958217349bb99961d279db75616.pdf

2. Updated document :  Plan2

Changes made to the method selection and planning:

1. Changed the development method section to match our assessment 1 development method section.

Justification: We use the same development method however they also describe their team's way of breaking down tasks which is different from ours.

2. Changed communication method from whatsapp to instagram.

Justification: We use the same tools for file sharing and organisation so those parts did not need changing however we use different methods of communication.

3. Changed team structure to match our team structure.

Justification: The previous group had clearly defined rules in the group (e.g team leader) whereas in ours someone would pick up a task that needed to be done and try to complete it and could ask for help from anyone if needed be.

4. Changed project plan to more accurately describe our course of action through the project.

Justification: The project plan on the assessment 1 document described the previous teams plan to tackle assessment 1 thus it was not a suitable description of how our team will tackle assessment 2.

5. Changed the milestones that need to be completed.

Justification: The milestones on the assessment 1 document were that of assessment 1 meaning they were no longer suitable milestones and needed to be updated to match that of tasks needed for assessment 2.

Risk assessment and mitigation

URLs: 1. Original document :

https://6708f185-154c-4209-83c3-4f5273aa7fbf.filesusr.com/ugd/53bd28_409a9d11f7d141e9a50c895dab759e97.pdf

2. Updated document :  Risk2

Changes made to the document risk assessment:

1. Removed all of the 'risk management process' section but kept the description of the table formatting.

Justification: We decided to completely change the risk management process to better suit our team and project. However, we kept the description and formatting of the risk table as it was clear and well described.

Changes to the risk assessment table:

2. Added 'R8': Addressing the complexity of the control system and its potential impact on user engagement.

Justification: This risk was included to ensure user experience remains a priority. By addressing this issue, we can improve the game's accessibility as well as appeal through testing and feedback-driven adjustments.

3. Added 'R9': Difficulty integrating previous team deliverables, codes, and website etc.

Justification: This risk was included to make sure the previous work is properly integrated. By reviewing the deliverables carefully and seeking help if needed, will ensure the project progresses without technical issues.

4. Added 'R10': The deliverables may not meet the required formats or exceed page limits, resulting in a mark of 0.

Justification: This risk was added to ensure all deliverables follow the correct format and page limit as it would influence all the marks.

5. Added 'R11': Limited time to make changes based on user feedback could affect whether the game meets user expectations.

Justification: This risk was added to ensure enough time is set aside for changes after doing user evaluation. It will allow our team to make necessary adjustments and meet user expectations.

6. Added 'R12': Ethical issues in user evaluation, such as improper consent or misuse of participant data.

Justification: This risk was added to make sure we follow ethical guidelines when we are doing user evaluation. Providing participants with information and consent forms helps protect their rights and ensures ethical standards are met.

7. Added 'R13': Difficulty recruiting enough participants for evaluation or getting incomplete feedback.

Justification: This risk was added to ensure the evaluation is successful as it is crucial for both project and product. By scheduling it early and avoiding busy periods, we can get complete and useful feedback to improve the game.

8. Added 'R14': Incomplete or ineffective testing coverage.

Justification: This risk was added to make sure testing covers all important aspects. A solid testing plan and peer reviews help identify issues before they become bigger problems.

9. Added 'R15': Team members may ignore essential requirements or may add unnecessary features that would result in wasting time.

Justification: This risk was added as there are more requirements needed in the part 2 of the assessment and it may get ignored. Setting clear requirements early and sticking to them will help avoid wasting time on unnecessary features and ensure we meet the project's main goals.

Changes to the Architecture:

1. Added Achievement and AchievementManager classes to diagram

Justification: The updated product brief describes a requirement for an achievements feature and so to meet this we needed to implement classes to manage, create and display the achievements to the user.

2. Added LeaderboardScreen and LeaderboardManager classes to diagram

Justification: In order to meet the updated product brief's criteria for a leaderboard we needed to create classes to manage and sort usernames and scores and then display them to the user at the end of the game and to do this we had to plan to add this to the architecture.

3. Added Events based classes to the diagram: ConditionalThoughtEvent, SimpleThoughtEvent, Event and EventManager

Justification: There was not yet a class planned in the architecture for future implementation of events to meet that requirement and so when planning our implementation we had to add a class to manage and create events.

4. Added a Satisfaction class to the diagram

Justification: In order to keep track of and update the score we had to create a new class. This helps meet the requirement of displaying an updating score to the user and adding it to the leaderboard at the end

5. Added a Thought class to the diagram

Justification: We created thoughts to allow the user to easily understand score changes and what they can do to increase score and so we added a plan to implement this class to the diagram

6. Changes to attributes and methods within GUImanager

Justification: In order to implement the new features to the game they would have to be displayed on screen and so we needed attributes and methods to access information on the objects, to be able to control when they could appear on screen etc.
